

Quality of the United States Soybean Crop: 2020

Seth Naeve and Jill Miller-Garvin
University of Minnesota

Soybean Outlook Conferences
November 17-19, 2020

Outline

- 2020 Weather highlights
- Historical protein and oil variation
- 2020 Soybean Survey results
 - Protein and Oil
 - Physical Characteristics
 - Amino Acids
 - Sucrose

CRITICAL WEATHER EVENTS

Environmental impacts on soybean Protein and oil

- Location-specific environmental impacts (latitude, climate, and soil type) affect long-term quality trends
- However, annual variation in weather patterns affects year-over-year variation in soybean quality
- Rainfall patterns appear to have the greatest impact on soybean quality
- Excessive rainfall early in the season appears to reduce protein deposition in the seed
- Drought conditions during the seed-filling stages exacerbate this condition

2020 Soybean Production

- Record early planting in Iowa and Minnesota
 - Early in Illinois, Indiana, Nebraska, and Wisconsin
- Severe drought centered on western Iowa, but extended across much of the central Corn Belt
- Extreme winds (derecho) passed through this area on August 10, 2020
 - 110-140 mph winds

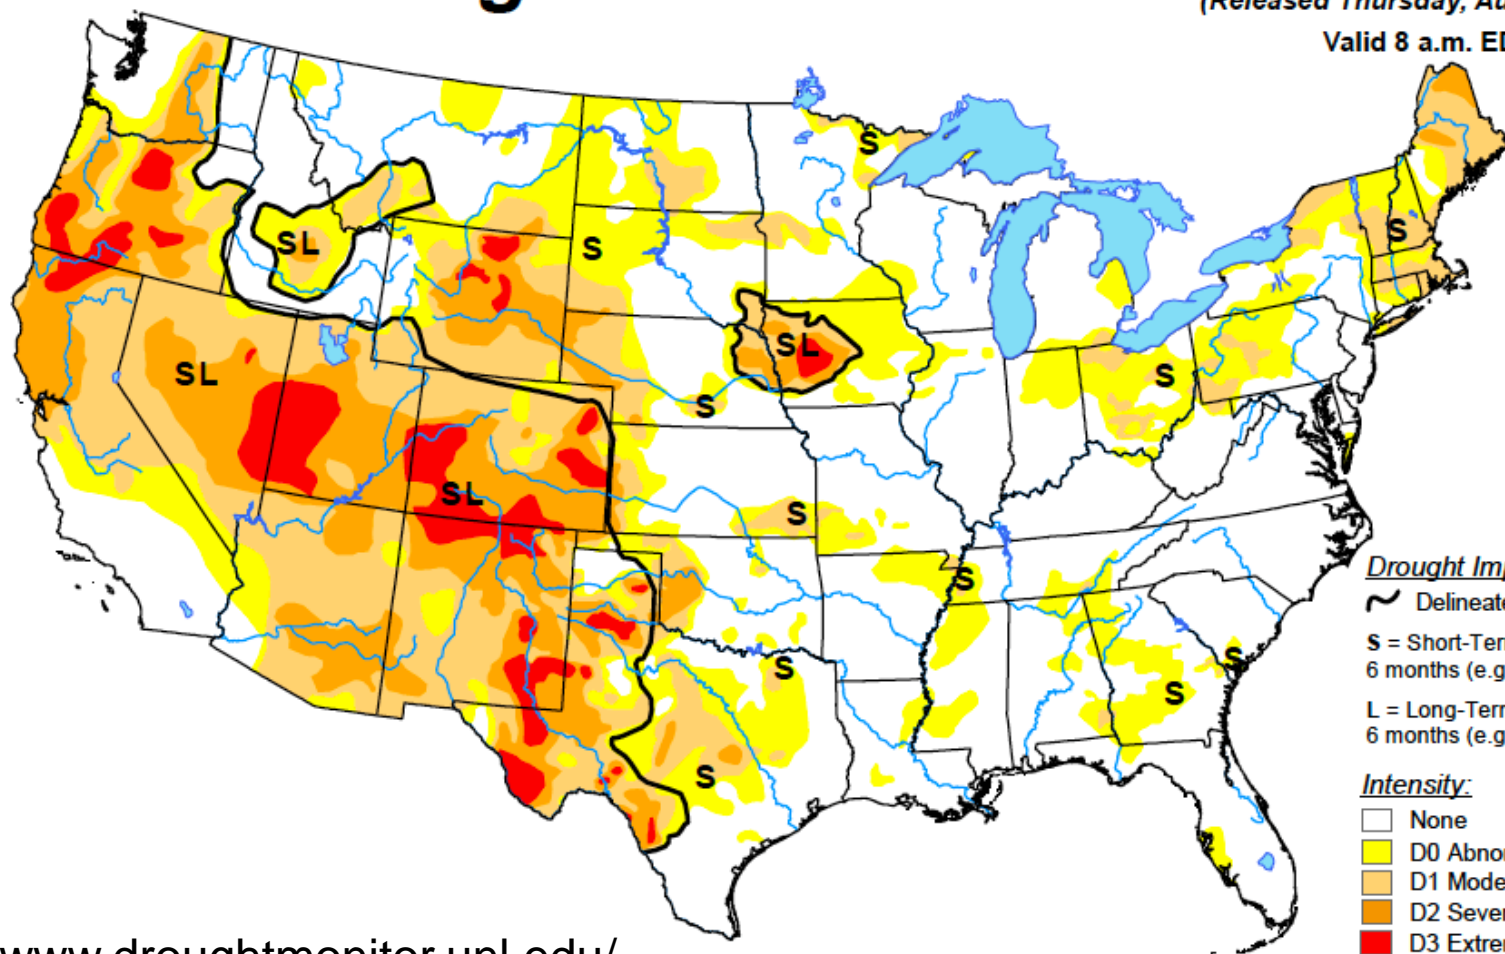

U.S. Drought Monitor

August 11, 2020

(Released Thursday, Aug. 13, 2020)

Valid 8 a.m. EDT

Drought Impact Types:

~ Delineates dominant imp

S = Short-Term, typically less
6 months (e.g. agriculture, gra

L = Long-Term, typically great
6 months (e.g. hydrology, ecol

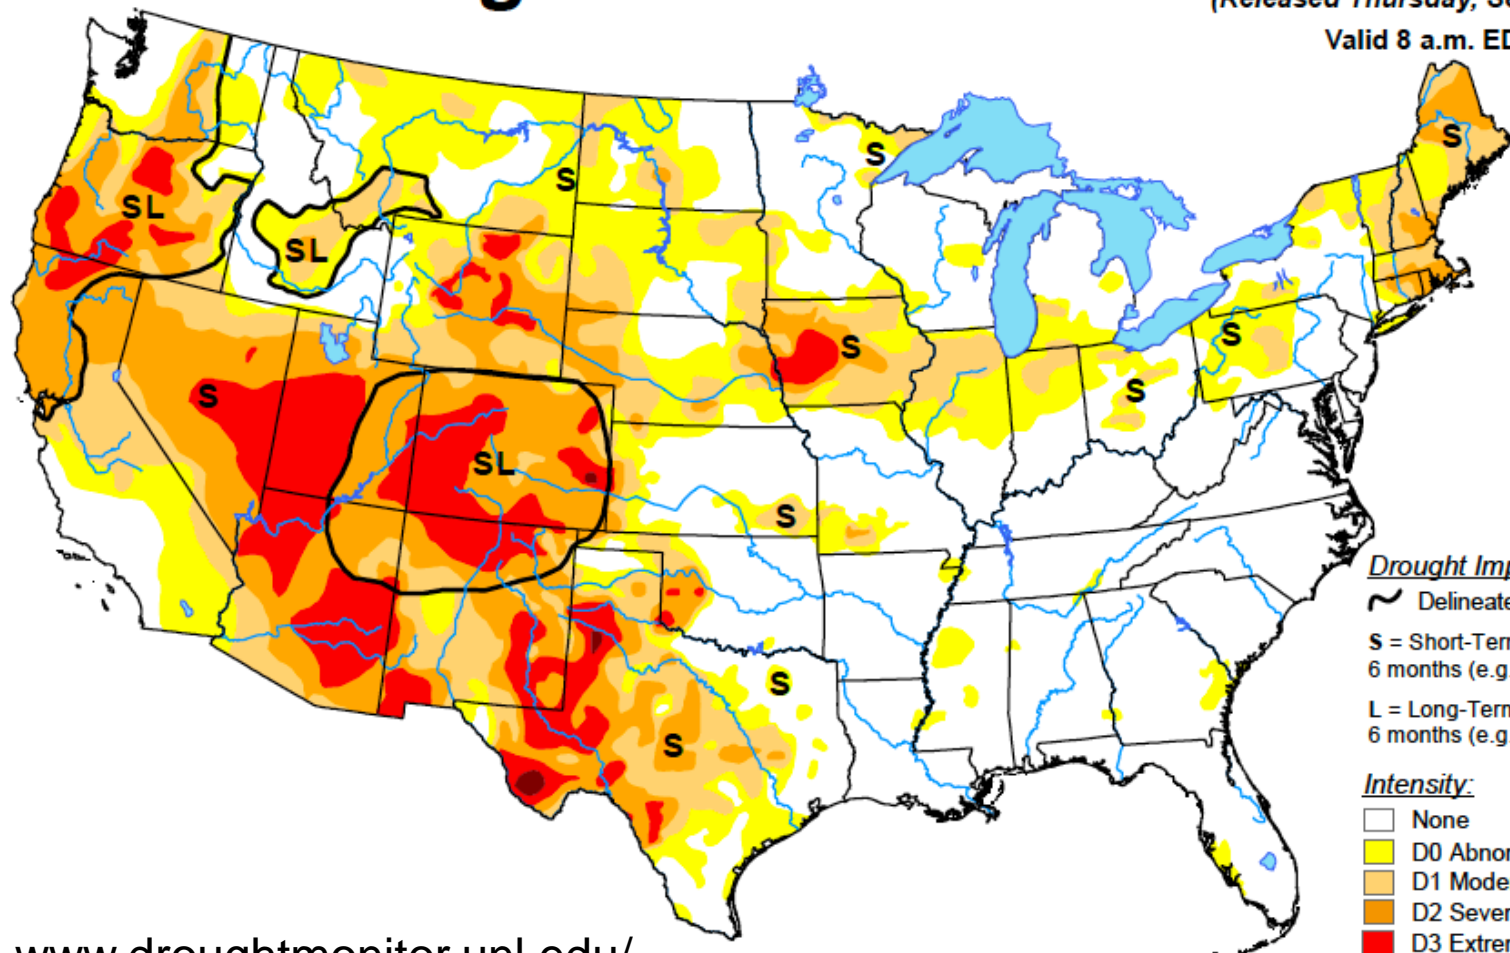

Intensity:

- None
- D0 Abnormally Dry
- D1 Moderate Drought
- D2 Severe Drought
- D3 Extreme Drought
- D4 Exceptional Drought

U.S. Drought Monitor

September 1, 2020
(Released Thursday, Sep. 3, 2020)

Valid 8 a.m. EDT

Drought Impact Types:

~ Delineates dominant impact

S = Short-Term, typically less than 6 months (e.g. agriculture, grazing)

L = Long-Term, typically greater than 6 months (e.g. hydrology, ecology)

Intensity:

- None
- D0 Abnormally Dry
- D1 Moderate Drought
- D2 Severe Drought
- D3 Extreme Drought
- D4 Exceptional Drought

August 10, 2020 Derecho: Lowest Angle NWS Radar Reflectivity at One-Hour Time Steps

All times in CDT

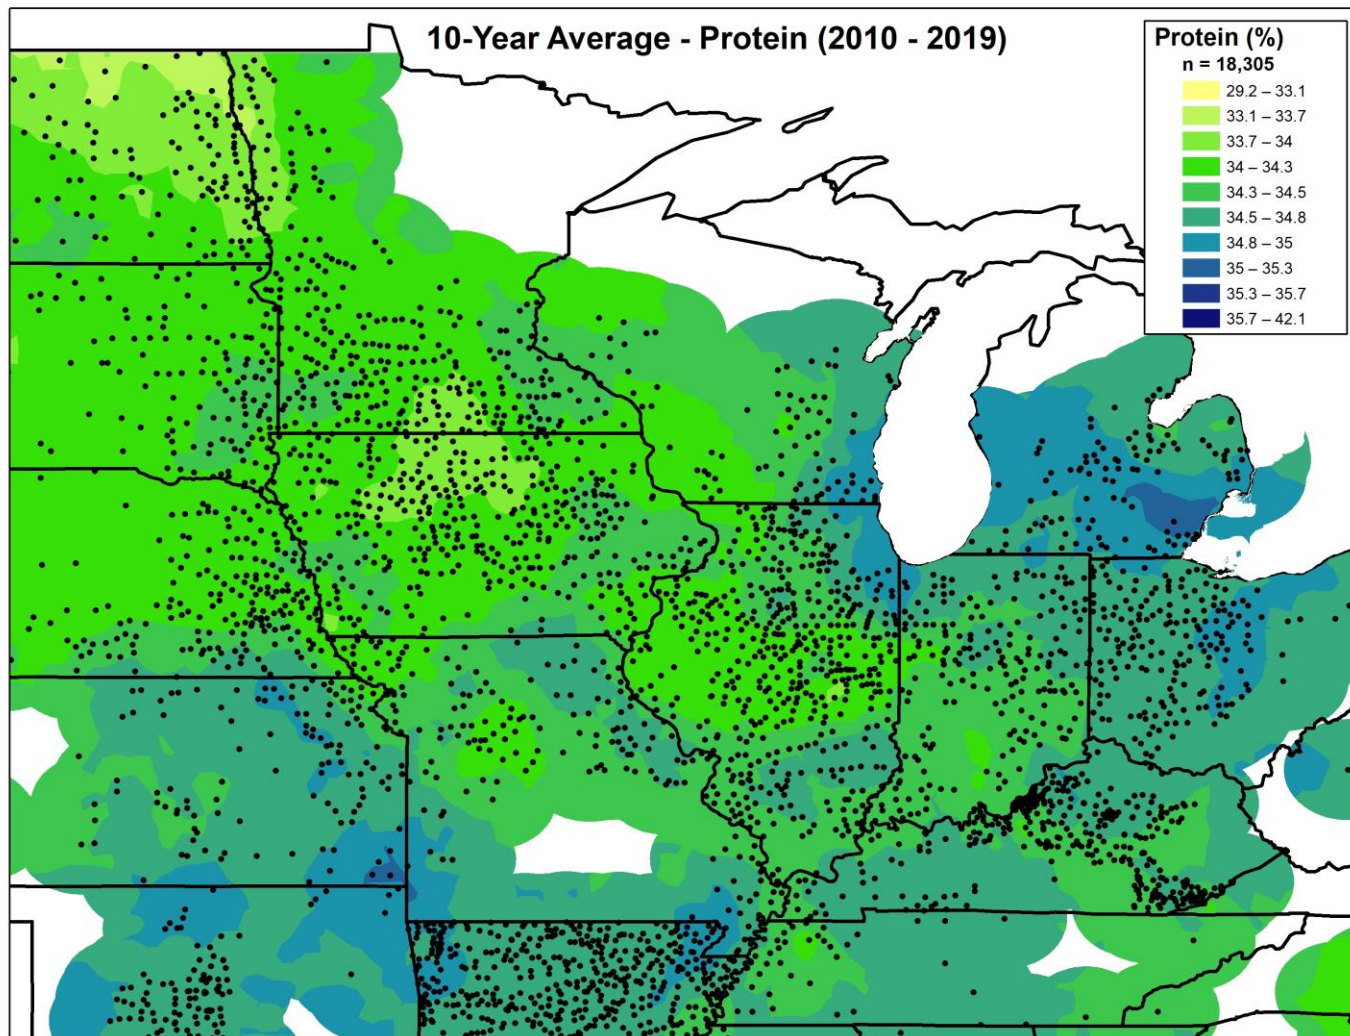

This long-lasting, severe wind thunderstorm complex (known as a derecho) produced hundreds of reports of damage along with likely a few tornadoes.

QUALITY OF THE UNITED STATES SOYBEAN CROP: 2020

A close-up photograph of several soybean pods hanging from a stem. The pods are brown and covered in fine, light-colored hairs. The background is a soft, out-of-focus brown. A dark rectangular box is overlaid in the center, containing the title text in white.

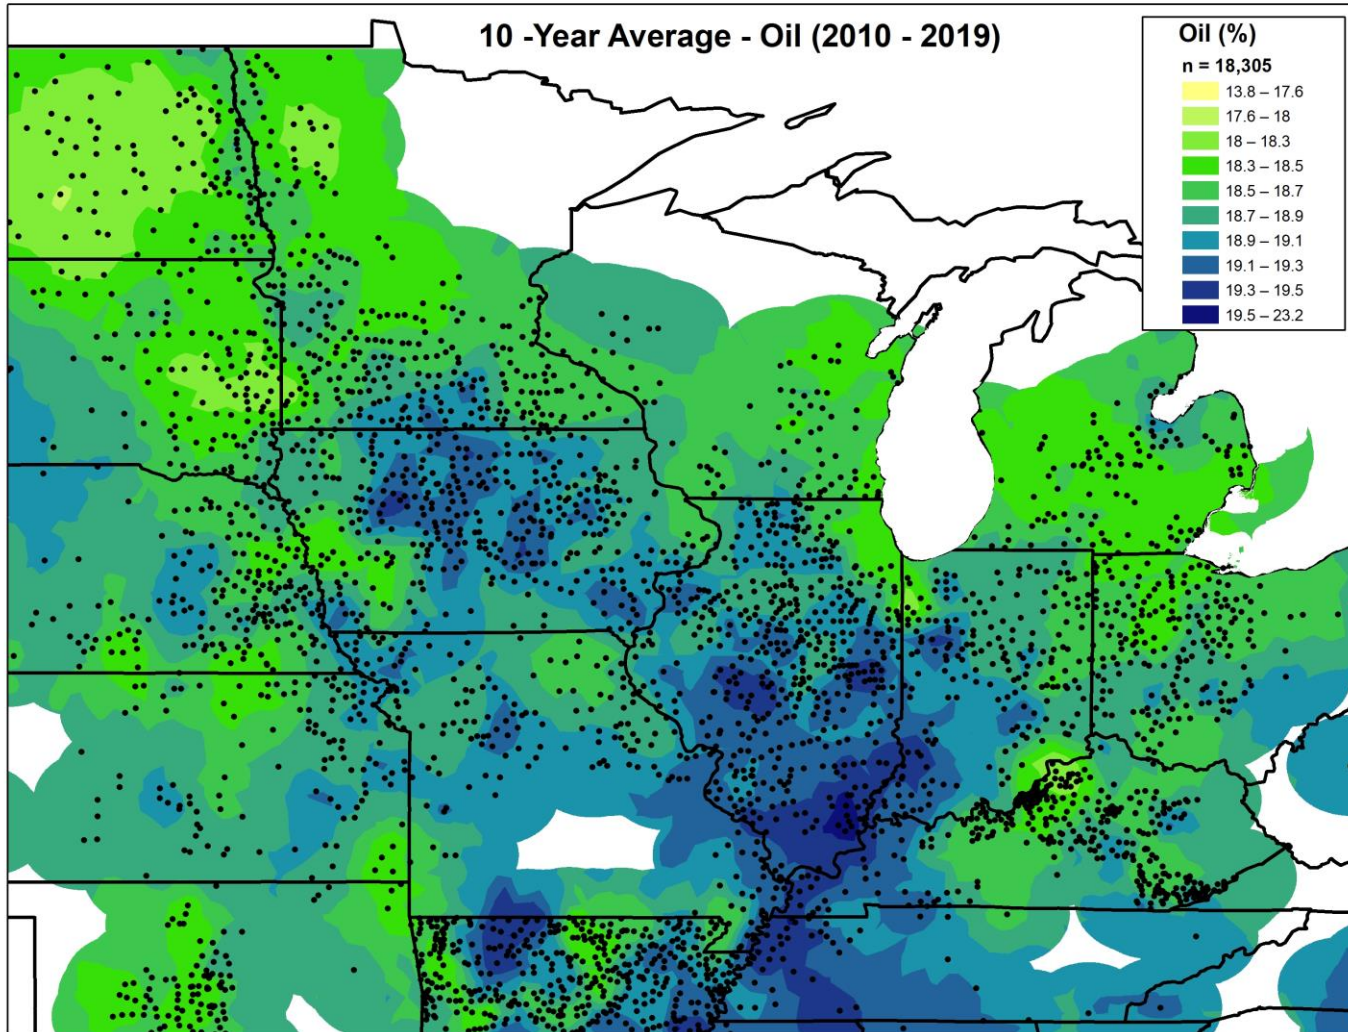

HISTORICAL PROTEIN AND OIL VARIATION

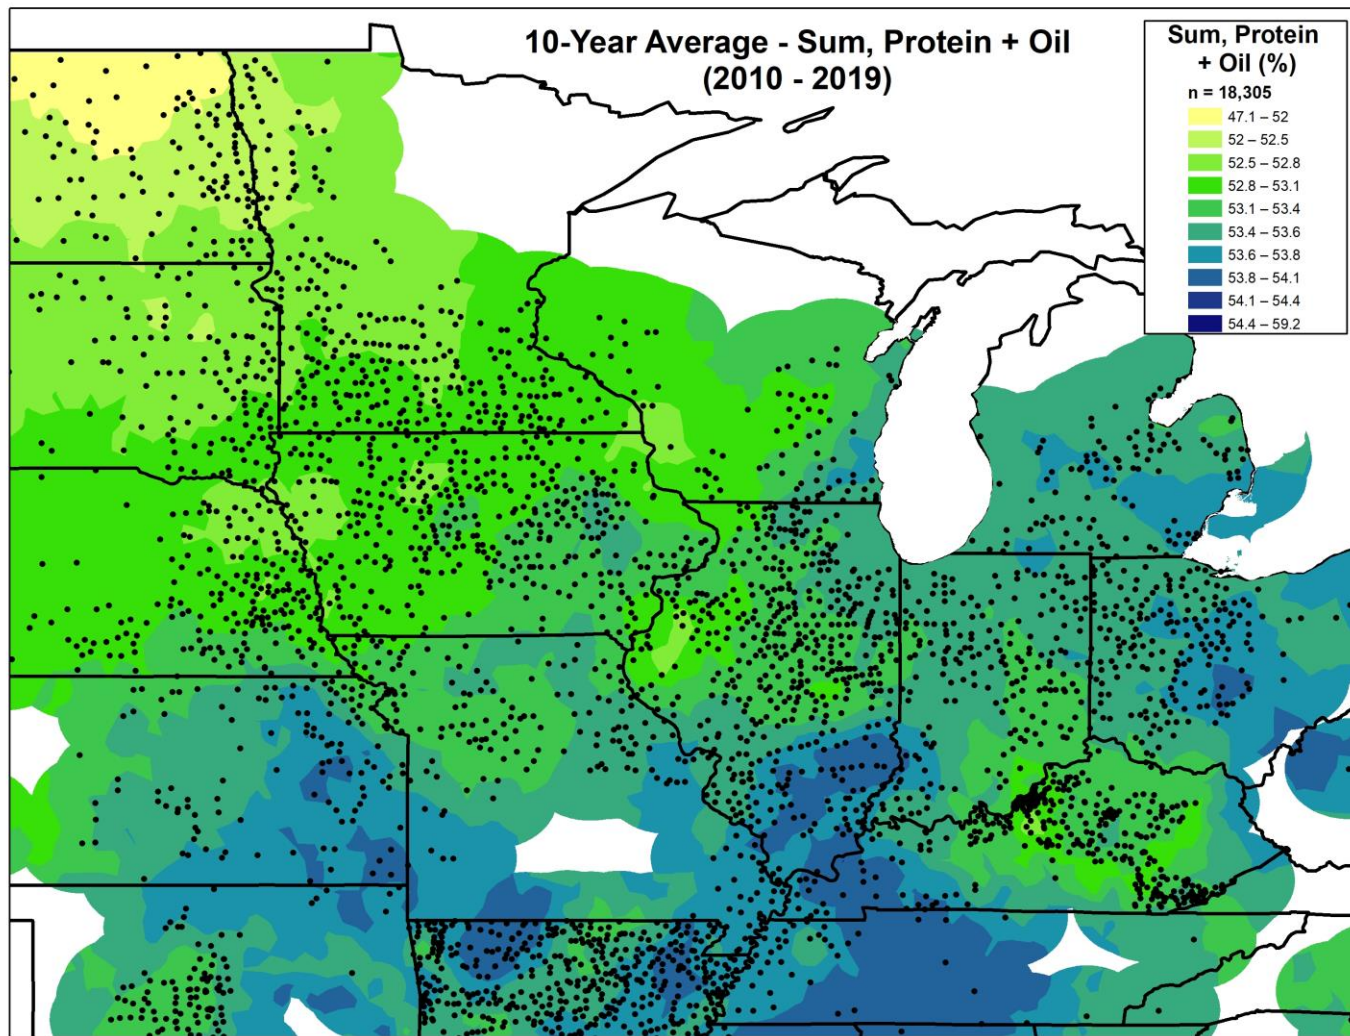

10 -Year Average - Oil (2010 - 2019)

Oil (%)

n = 18,305

2020 SURVEY RESULTS

UNIVERSITY OF MINNESOTA

SOY.ORG

2020 Survey Methods

- In August, sample kits were mailed to 5,800 soybean producers based on soybean production by state
- By October 28, 2020, 1,285 samples were returned for analysis

PLEASE SEND SAMPLES BY OCTOBER 23

FILL BAG TO HERE >

2020 SOYBEAN QUALITY SURVEY

Town nearest field sampled (zip code or name): _____

Variety (company and variety name): _____

If specialty variety, please check below:

High oleic ☐ Food grade ☐ Non-GMO ☐

2020 Survey Methods - Protein and Oil

Diode Array 7250

At-line & Lab NIR Analysis System

- Samples were analyzed for protein and oil concentration by Near Infrared Spectroscopy (NIRS) using a Perten® diode array instrument
- Average protein and oil values were determined by state
- Regional and US average values were determined by weighting averages based on estimated 2020 production

PROTEIN AND OIL

UNIVERSITY OF MINNESOTA

 **SOY.ORG**

Region	Number of Samples	Protein (13%)	Change from 2019	Oil (13%)	Change from 2019	Seed Weight (g/100 seeds)
US Average	1,285	33.2		20.4		16.1
Average of 2020 Crop [†]		33.2	-0.9	20.5	+1.5	15.8
US 2010-2019 Average [†]		34.4		18.9		

[†]US average values weighted based on estimated production by state, as estimated by USDA, NASS Crop Production Report (October, 2020)

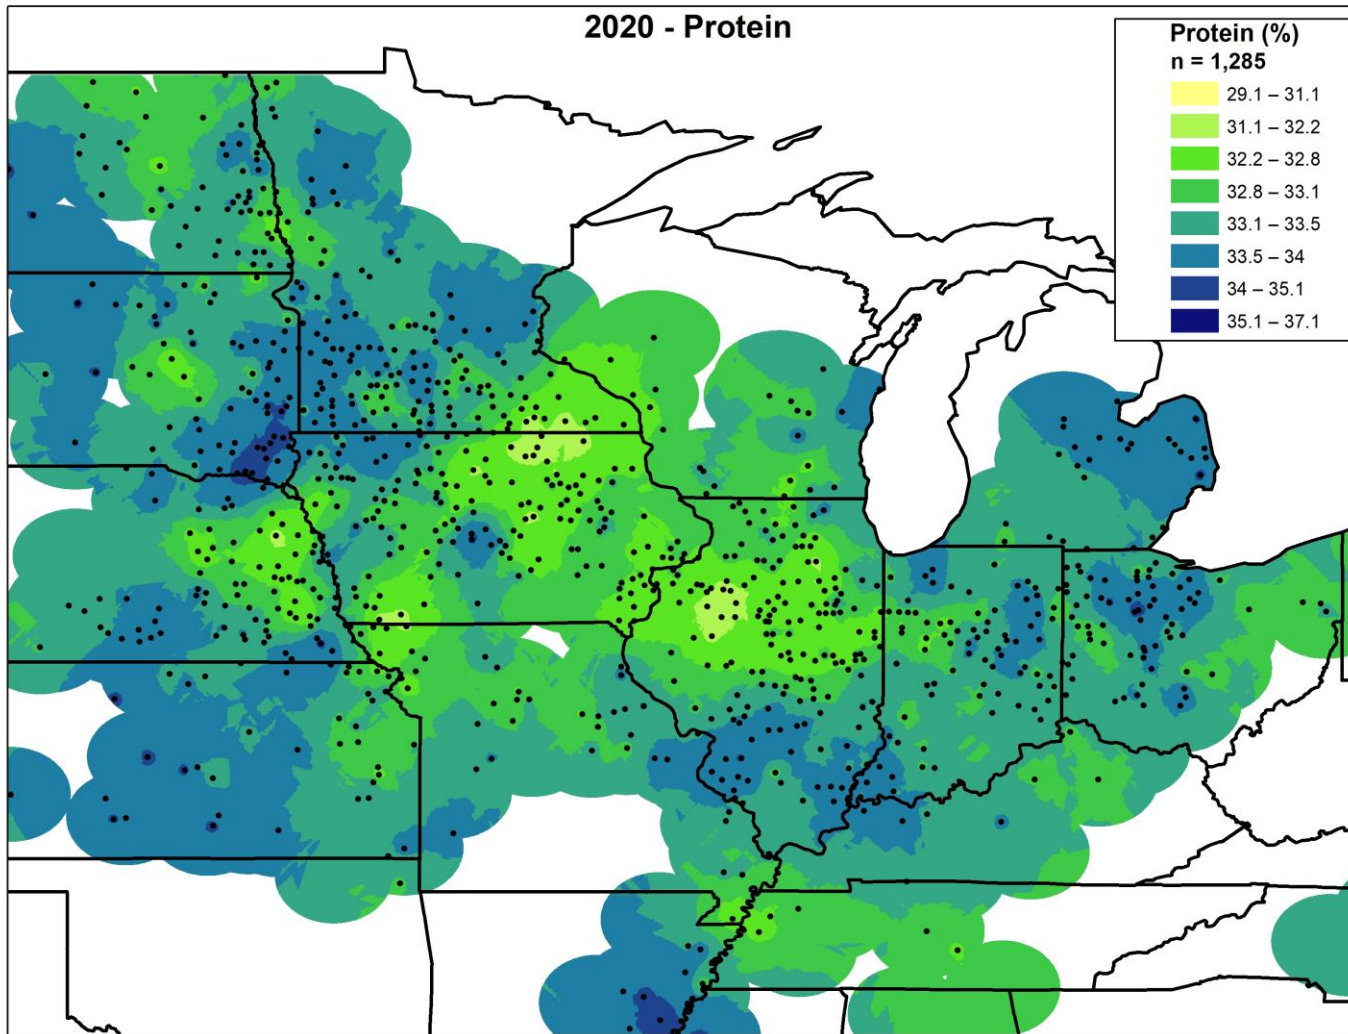

State Protein and Oil: Relative to Total Production

State Protein and Oil: Relative to Total Production

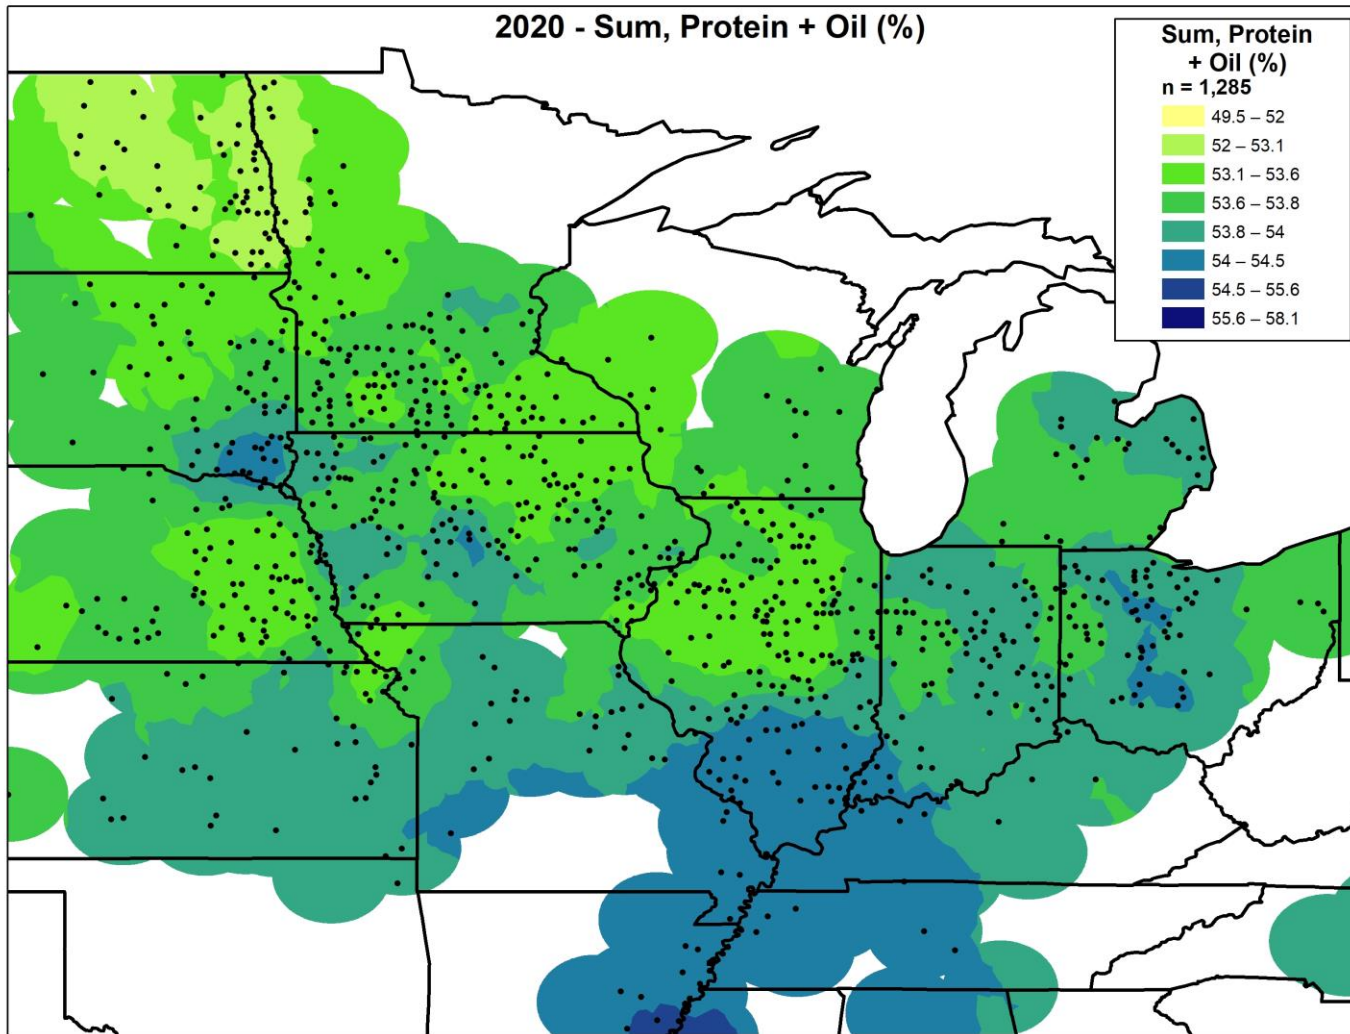

2020 - Protein

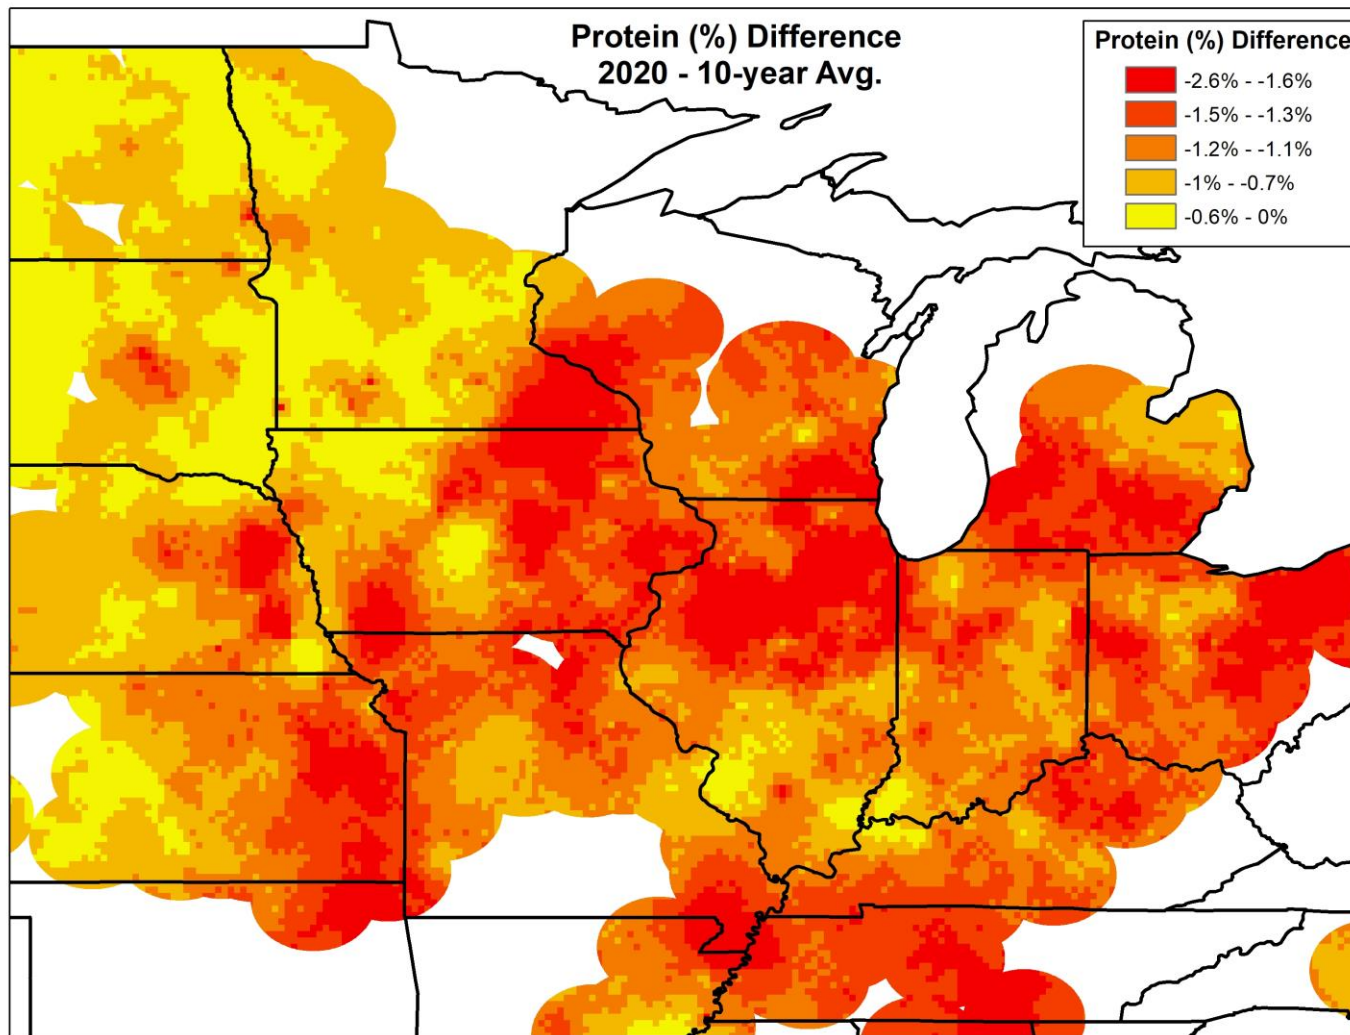

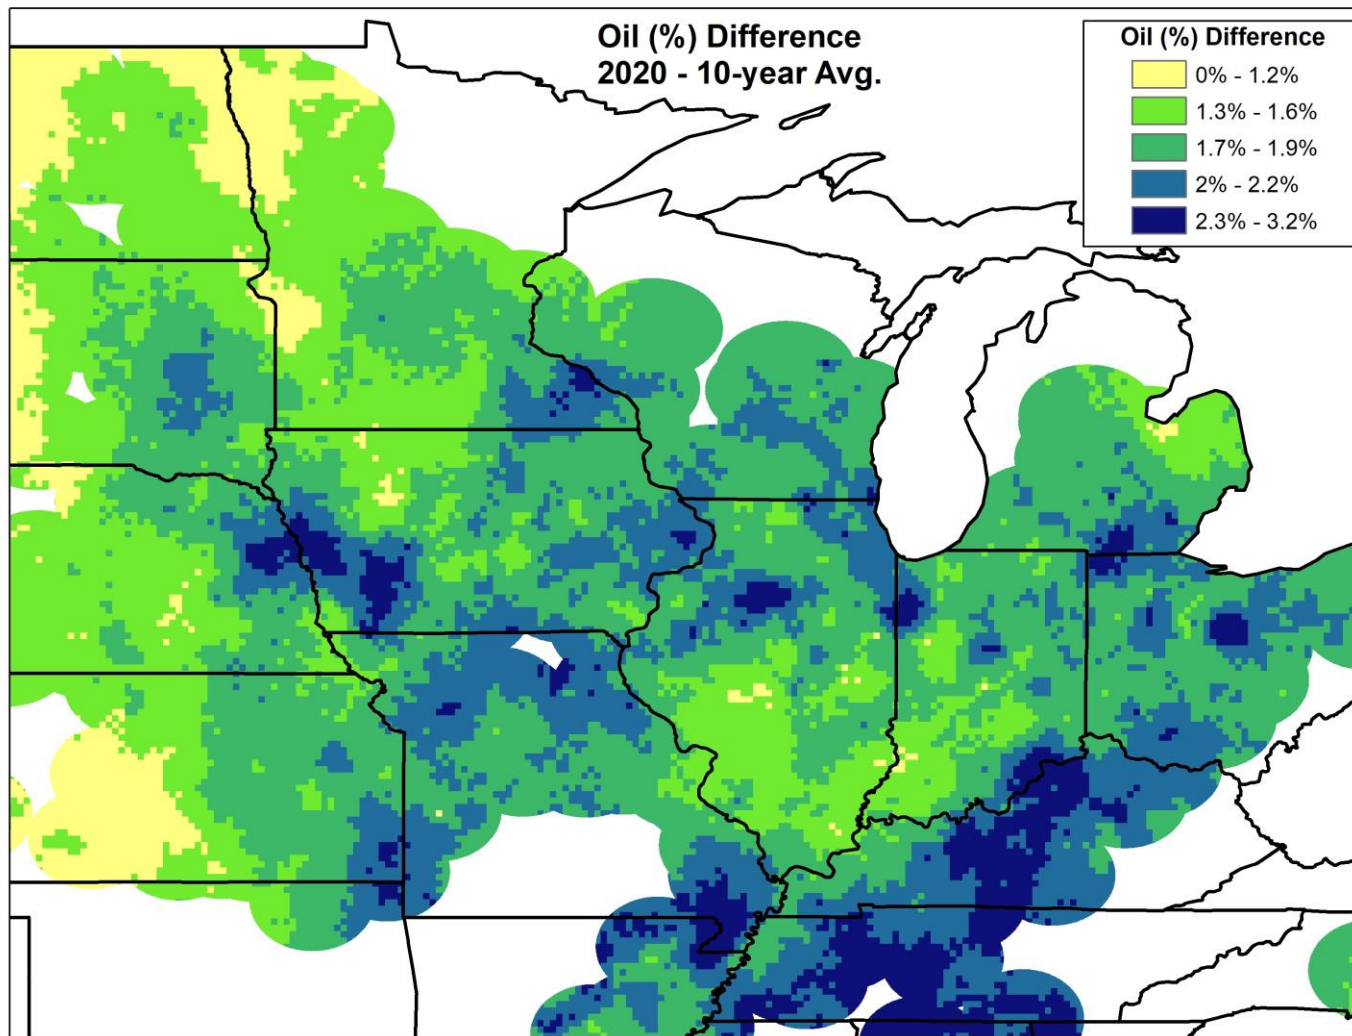

2020 - Oil

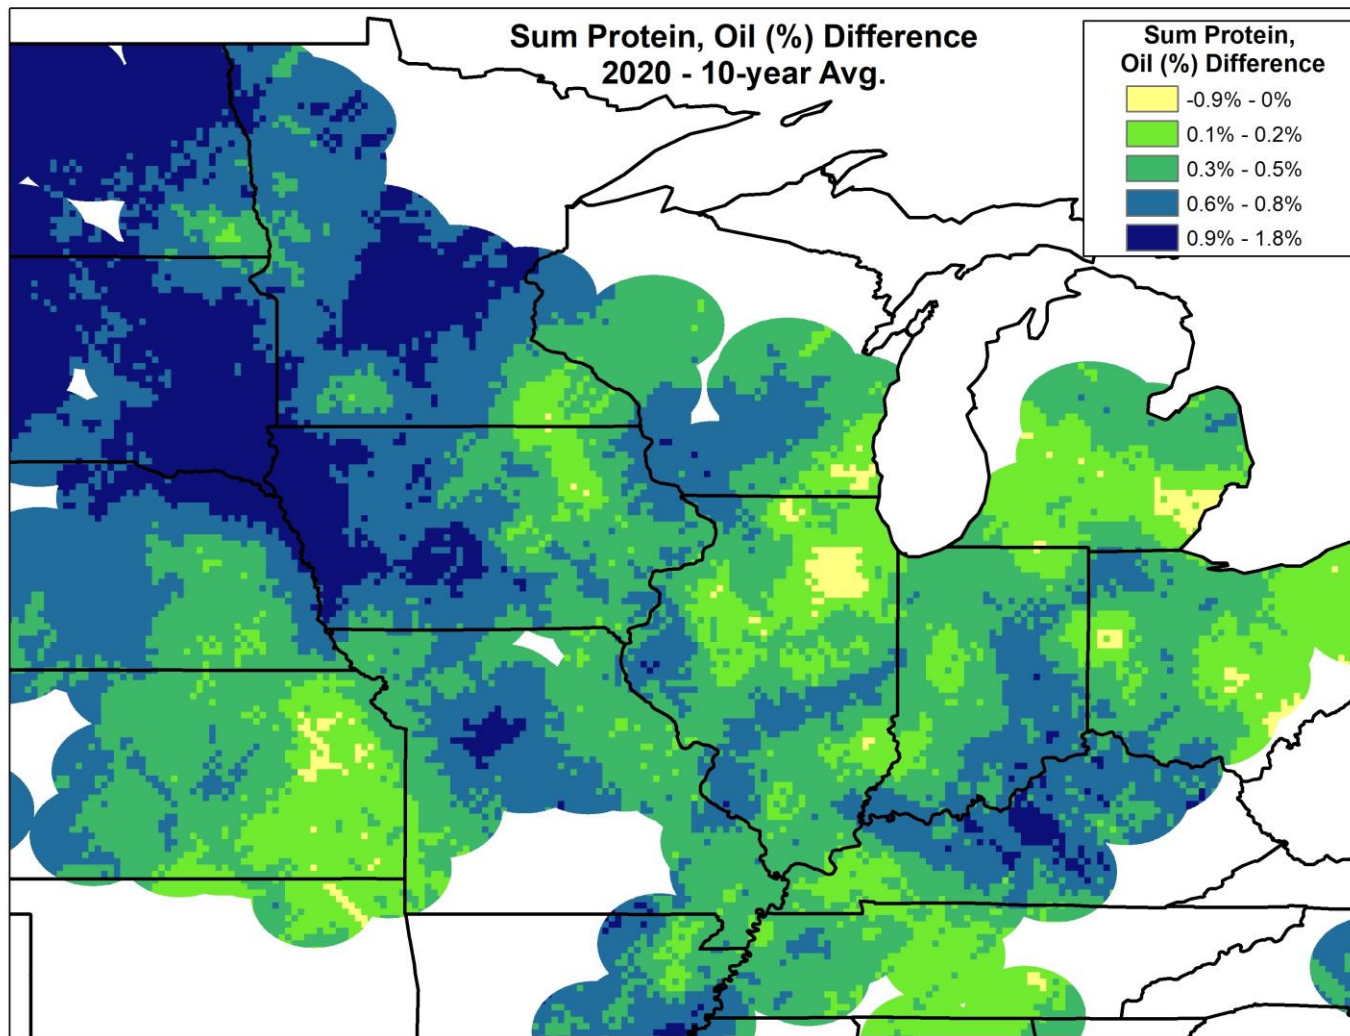

2020 - Sum, Protein + Oil (%)

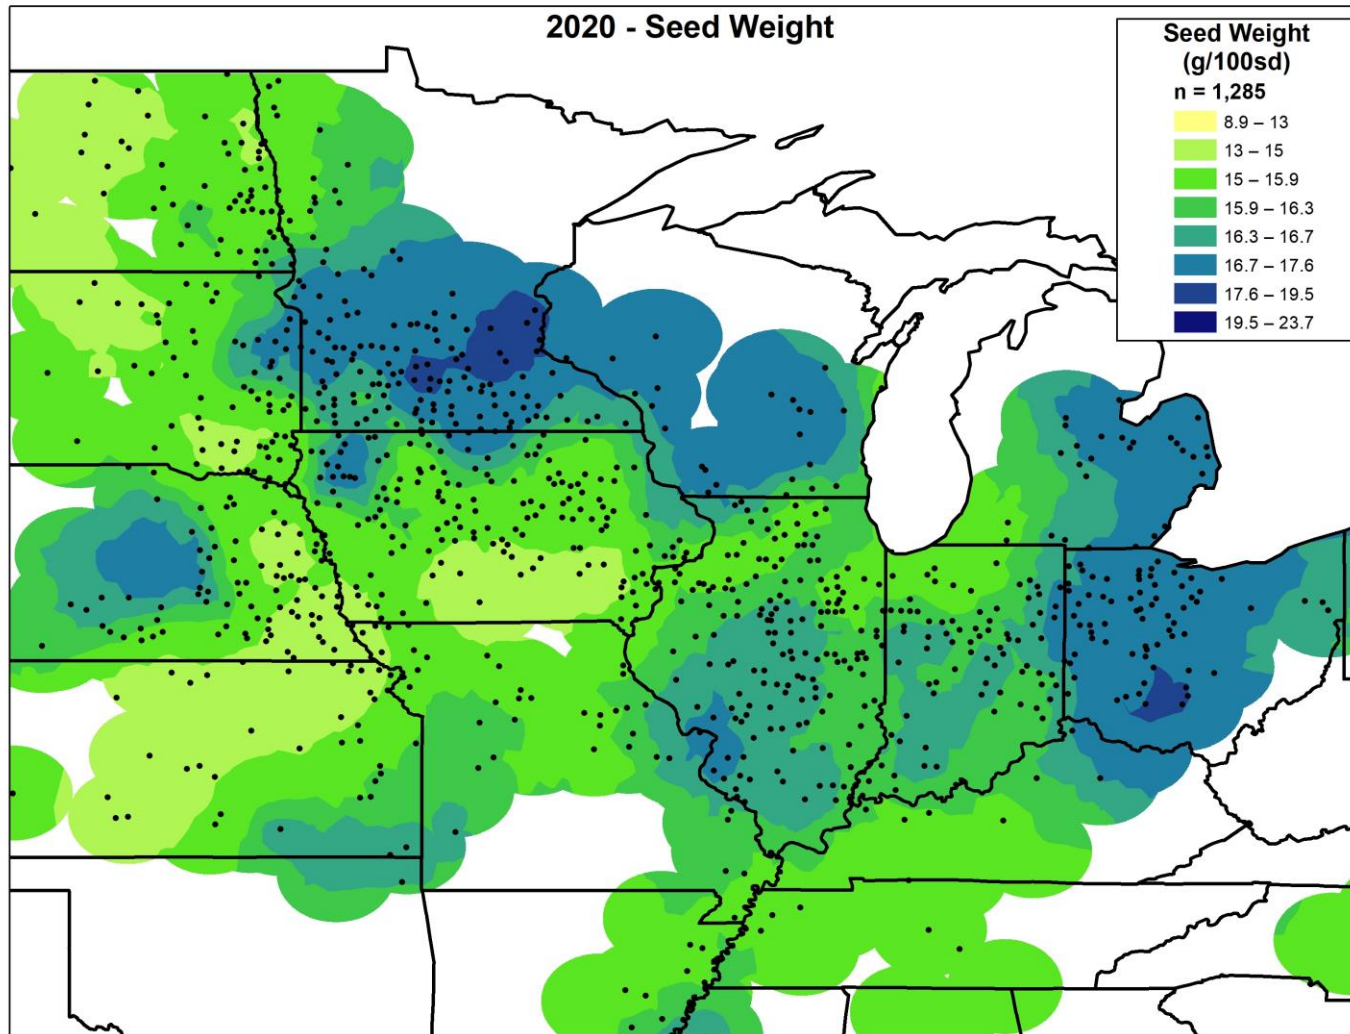

PHYSICAL CHARACTERISTICS

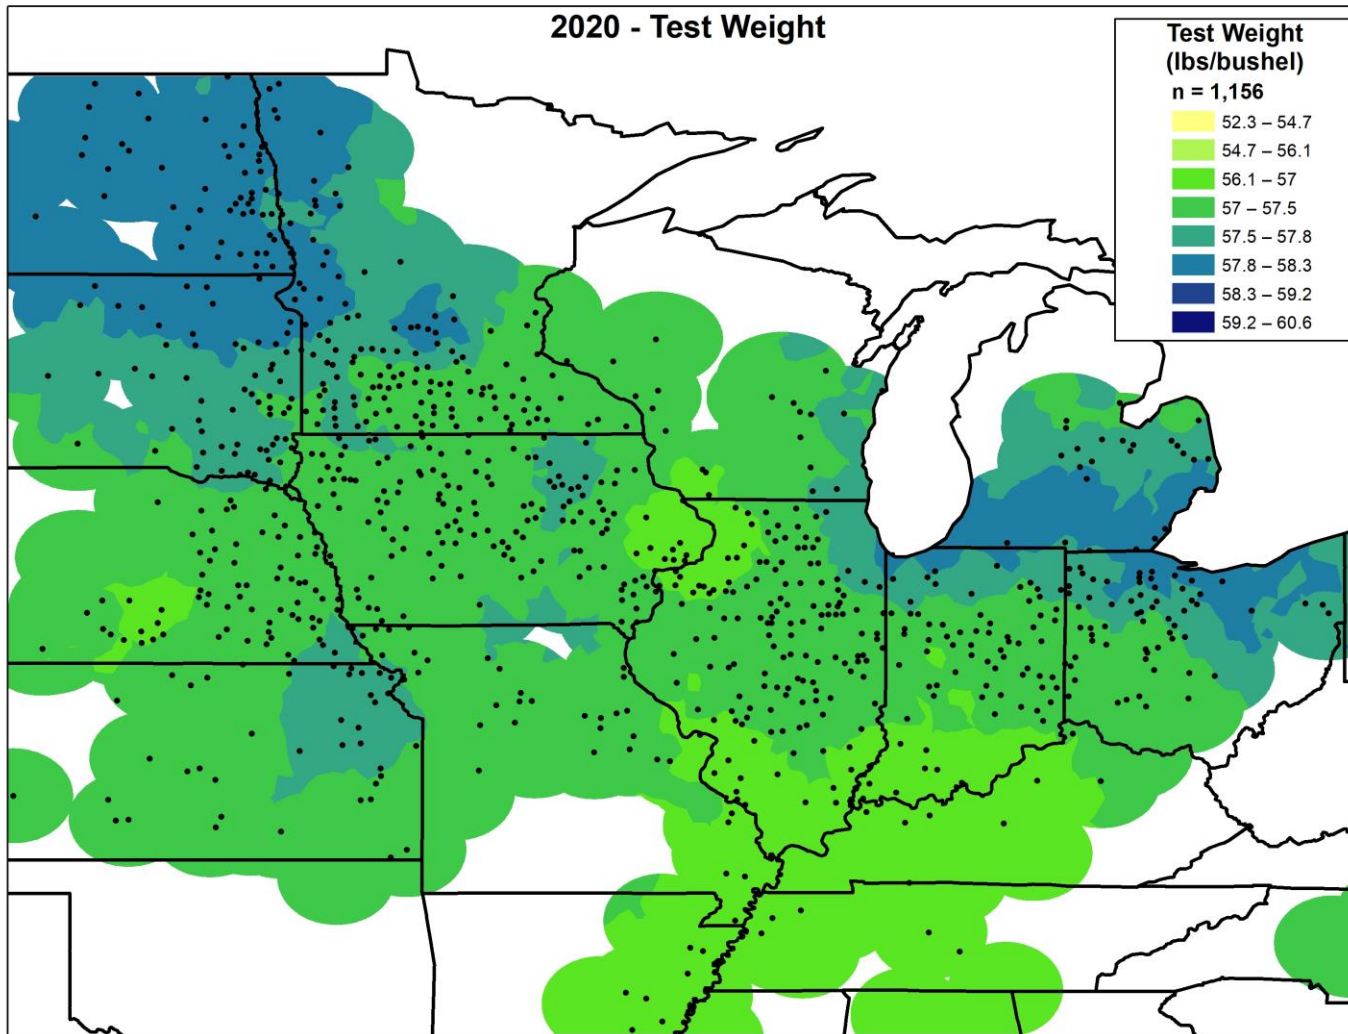

2020 - Incoming Moisture (%)

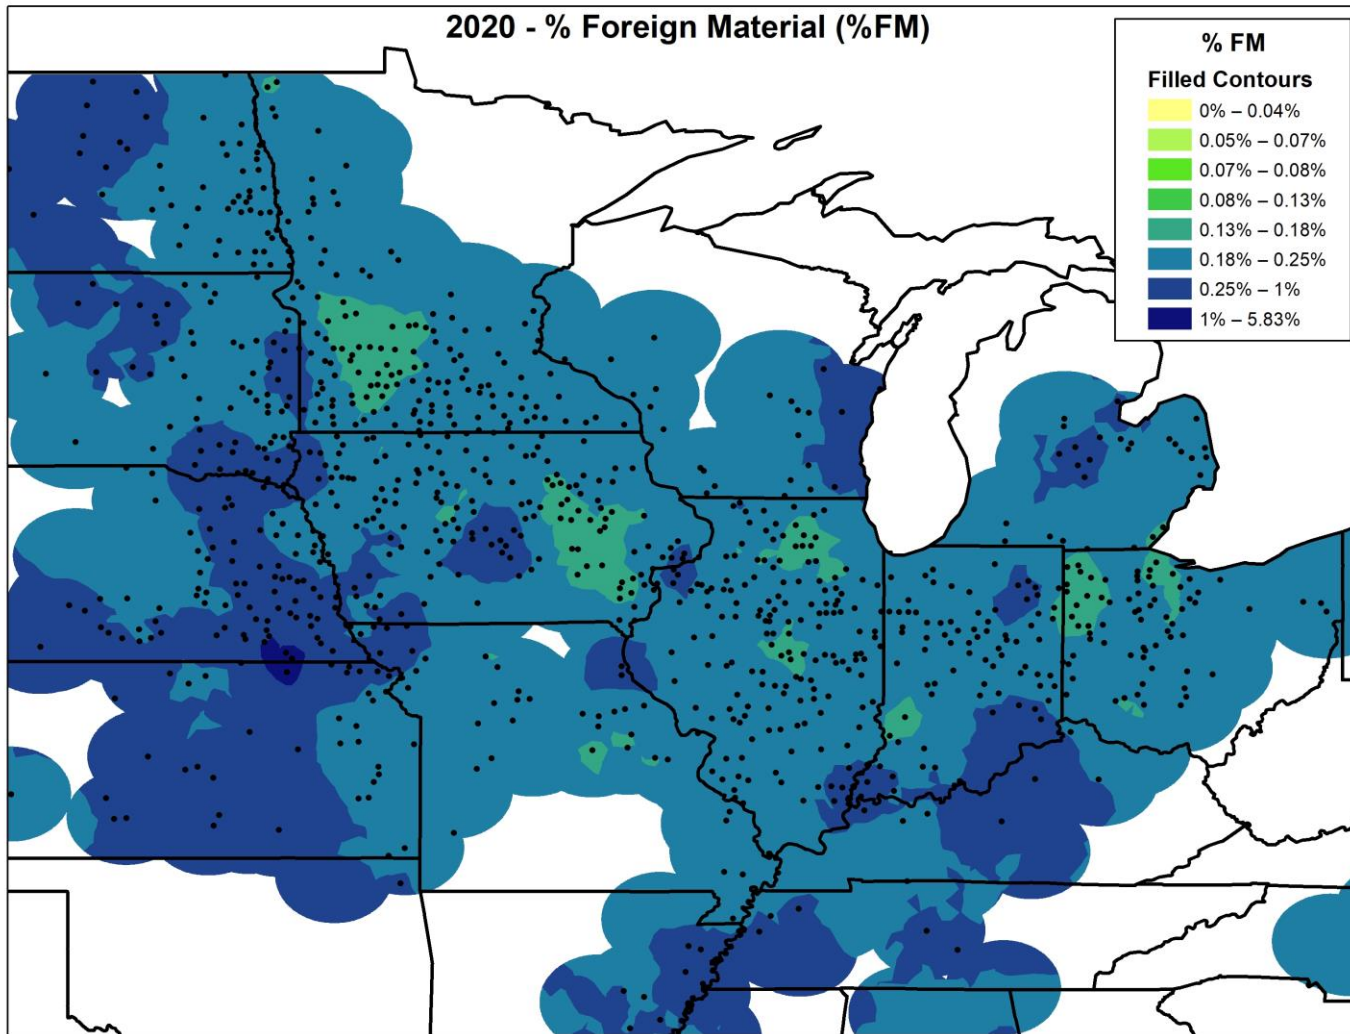

2020 - Seed Weight

2020 - Test Weight

2020 - % Foreign Material (%FM)

Better Measures of the Value of Soybeans

- Soybeans & soybean meal have been valued primarily on an indirect measure of protein – ‘crude protein’
- Crude protein is probably not the best measure of a soybean (or a soybean meal’s) value
 - Overestimates total amino acids (true protein) at higher protein levels
 - No information on protein QUALITY (relative balance of amino acids)
- Both formal and informal feeding trials in destination countries have repeatedly shown that meal from US soybeans performs better than expected based on protein levels

BETTER MEASURES OF QUALITY:

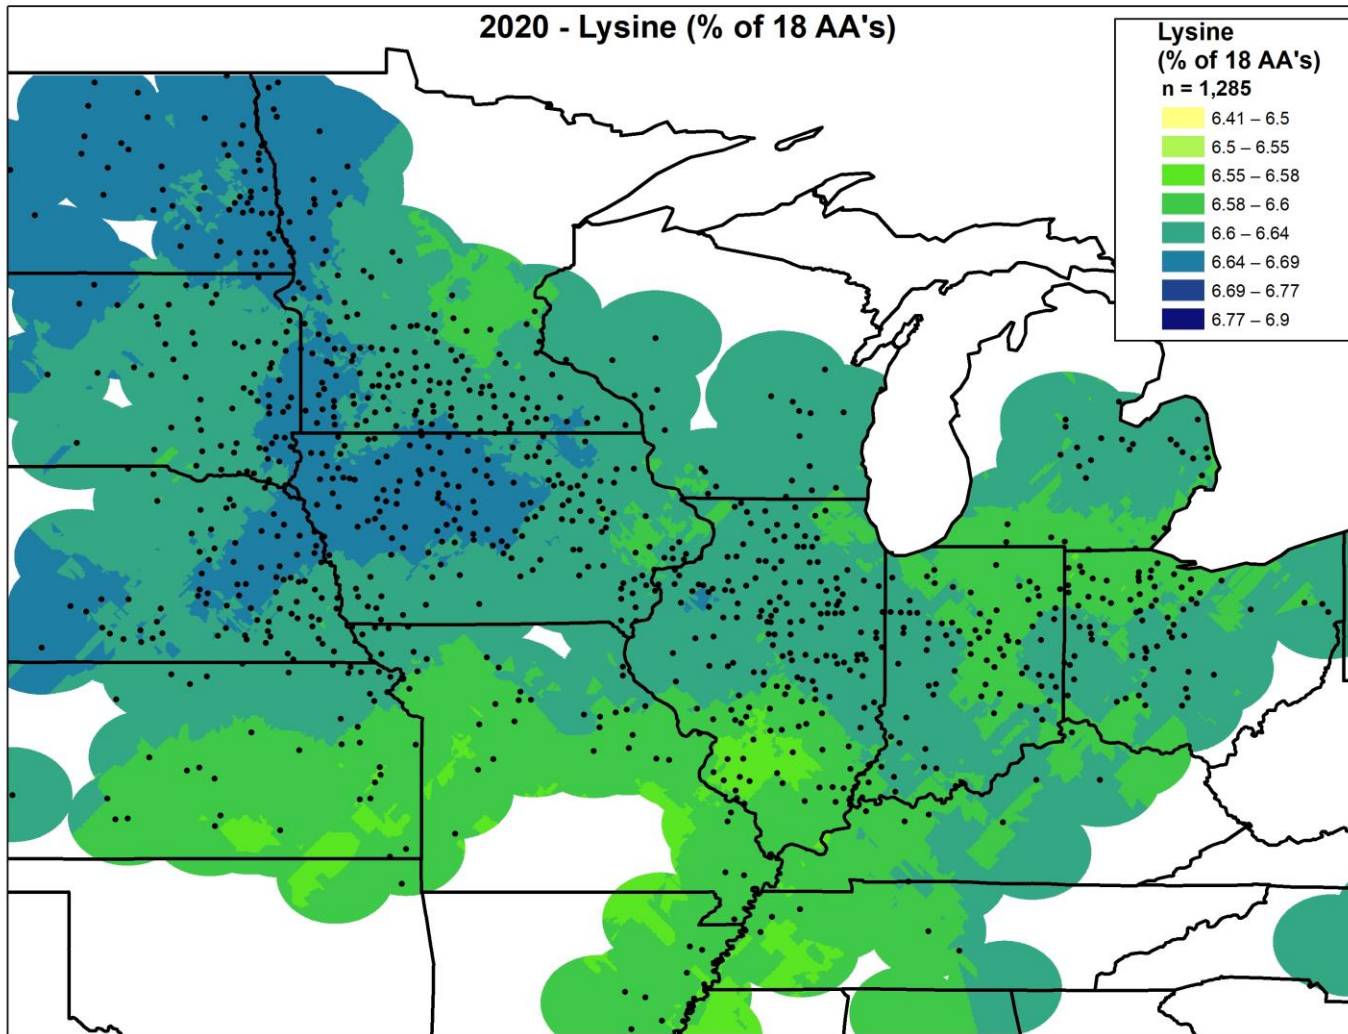

AMINO ACIDS ARE THE BUILDING BLOCKS OF PROTEINS IN LIVING ORGANISMS. THERE ARE OVER 500 AMINO ACIDS FOUND IN NATURE - HOWEVER, THE HUMAN GENETIC CODE ONLY DIRECTLY ENCODES 20. 'ESSENTIAL' AMINO ACIDS MUST BE OBTAINED FROM THE DIET. NON-ESSENTIAL AMINO ACIDS CAN BE SYNTHESISED IN THE BODY.

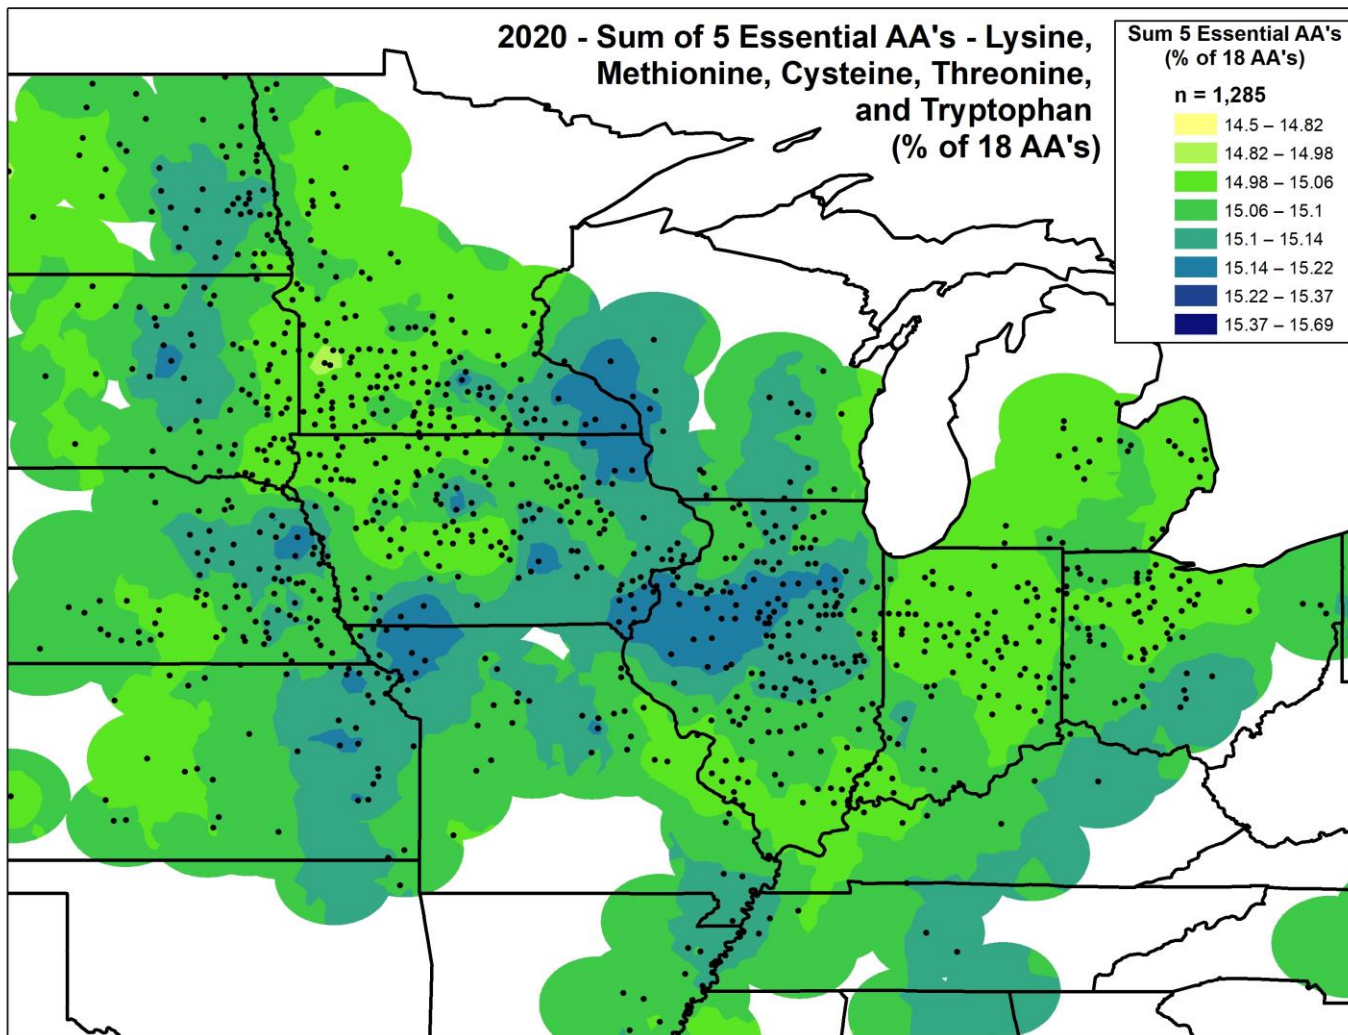

Chart Key: ● ALIPHATIC ● AROMATIC ● ACIDIC ● BASIC ● NEUTRAL ● HYDROPHILIC ● HYDROPHOBIC ● CONTAINING ● AMIDIC ○ NON-ESSENTIAL ○ ESSENTIAL

Note: This chart only shows those amino acids for which the human genetic code directly codes for. Selenocysteine is often referred to as the 21st amino acid, but is encoded in a special manner. In some cases, distinguishing between asparagine/aspartic acid and glutamine/glutamic acid is difficult. In these cases, the codes asx (B) and glx (Z) are respectively used.

2020 - Lysine (% of 18 AA's)

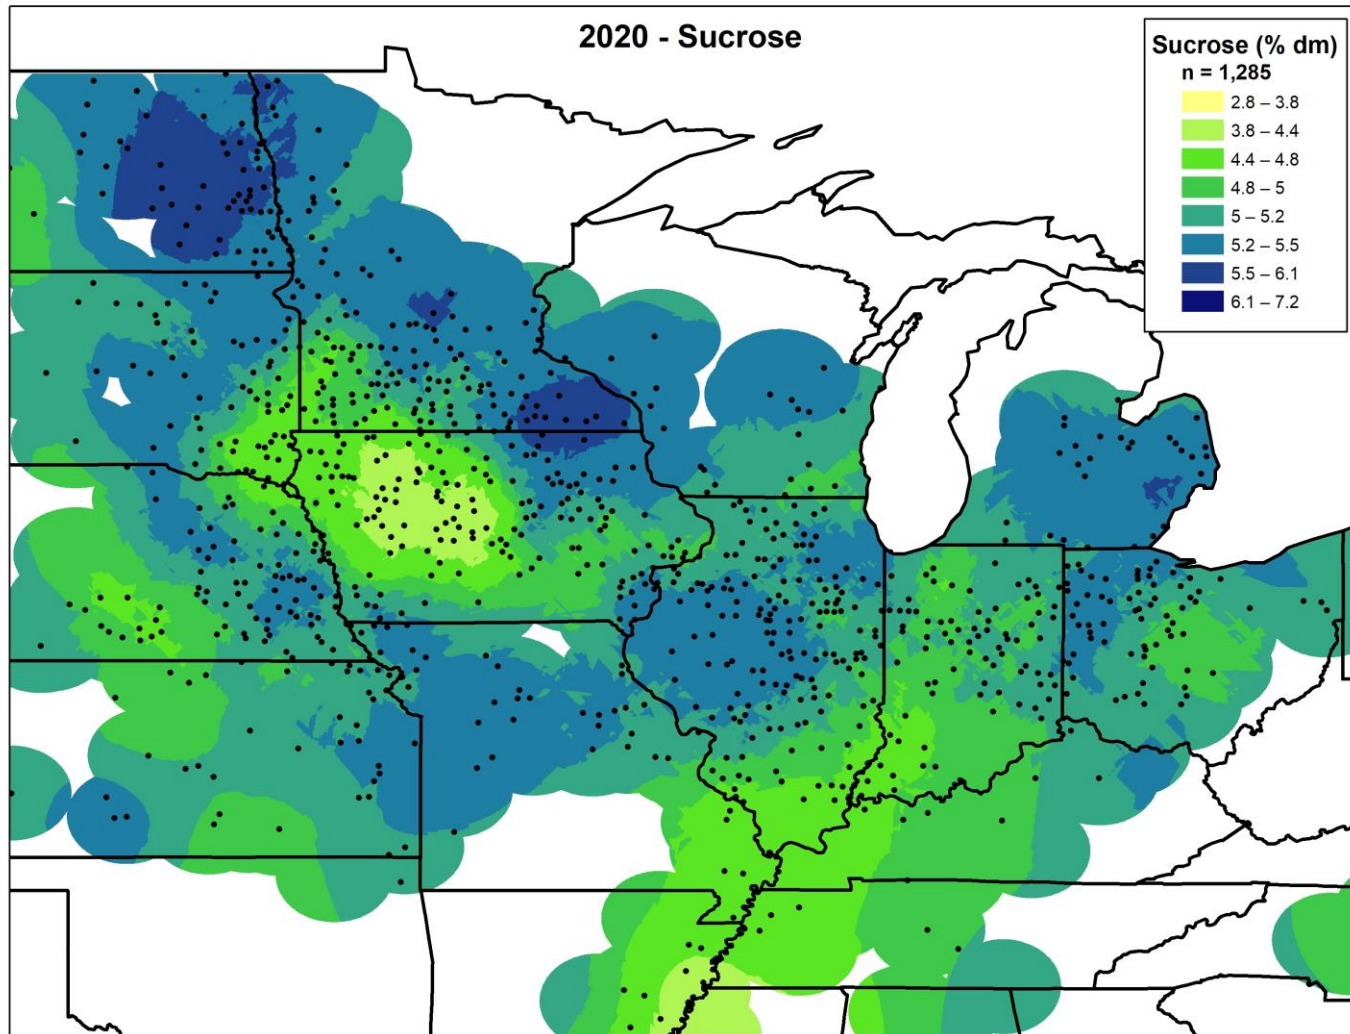

BETTER MEASURES OF QUALITY: SOLUBLE SUGARS

2020 - Sucrose
